Hortonworks Data Platform: Release Notes

Copyright © 2012-2017 Hortonworks, Inc. Some rights reserved.

The Hortonworks Data Platform, powered by Apache Hadoop, is a massively scalable and 100% open source platform for storing, processing and analyzing large volumes of data. It is designed to deal with data from many sources and formats in a very quick, easy and cost-effective manner.

The Hortonworks Data Platform consists of the essential set of Apache Software Foundation projects that focus on the storage and processing of Big Data, along with operations, security, and governance for the resulting system. This includes Apache Hadoop – which includes MapReduce, Hadoop Distributed File System (HDFS), and Yet Another Resource Negotiator (YARN) – along with Ambari, Falcon, Flume, HBase, Hive, Kafka, Knox, Oozie, Phoenix, Pig, Ranger, Slider, Spark, Sqoop, Storm, Tez, and ZooKeeper. Hortonworks is the major contributor of code and patches to many of these projects. These projects have been integrated and tested as part of the Hortonworks Data Platform release process and installation and configuration tools have also been included.

Unlike other providers of platforms built using Apache Hadoop, Hortonworks contributes 100% of our code back to the Apache Software Foundation. The Hortonworks Data Platform is Apache-licensed and completely open source. We sell only expert technical support, [training](#) and partner-enablement services. All of our technology is, and will remain, free and open source.

Please visit the [Hortonworks Data Platform](#) page for more information on Hortonworks technology. For more information on Hortonworks services, please visit either the [Support](#) or [Training](#) page. Feel free to [contact us](#) directly to discuss your specific needs.

1. HDP 2.6.3 Release Notes

This document provides you with the latest information about the Hortonworks Data Platform (HDP) 2.6.3 release and its product documentation. In addition to the standard information provided by HDP release notes, you will also find information on:

- [Component Differences between HDP and IOP \[3\]](#)

- [Known Issues for IOP \[7\]](#)

1.1. Component Versions

The official Apache versions of all HDP 2.6.3 components are listed below. All components listed here are official Apache releases of the most recent stable versions available.

The Hortonworks approach is to provide patches only when necessary, to ensure the interoperability of components. Unless you are explicitly directed by Hortonworks Support to take a patch update, each of the HDP components should remain at the following package version levels, to ensure a certified and supported copy of HDP 2.6.3.

Official Apache versions for HDP 2.6.3:

1.6. Upgrading to HDP 2.6.3

If you already have HDP 2.6.0 installed, upgrading your cluster to HDP 2.6.3 means:

- Keeping the same configuration files you used for HDP 2.6.0.

- Keeping the same data and metadata in the same location you used for HDP 2.6.0
- Installing any new components (added for the first time in HDP 2.6.0) side-by-side with existing components

1.6.1. Before you begin

- Ensure that you know which HDP components you need to upgrade at your installation.
- Decide whether you are going to upgrade using a [local repository](#) or a [remote repository](#).
- If you are using the Falcon service, install the Berkeley DB prior to performing an upgrade.

See the [Prerequisite to Installing or Upgrading Falcon](#) in the Data Movement and Integration guide.

1.6.2. Upgrade options

- If you are upgrading your cluster manually, use the [Non-Ambari Upgrade Guide](#).
- If you are upgrading your cluster through Ambari, use the [Ambari Upgrade Guide](#)

More information:

- [Upgrading HDP](#)
- [Register and Install HDP Version](#)

1.7. Behavioral Changes

Behavioral changes denote a marked change in behavior from the previously released version to this version of software. In HDP 2.6.3, behavioral changes affect the following Hadoop components.

Table 1.3. Behavioral Changes

Hortonworks Bug ID	Apache Component	Apache JIRA	Summary	Details
BUG-66121	Hive	HIVE-14251	Union All of different types resolves to incorrect data	<p>Scenario: UNION result handling</p> <p>Previous Behavior: queries in which union operator was used may have created an invalid output type.for example, the column type is ambiguous in the following query:</p> <pre>select cast(1 as int) union select cast(1 as string)</pre> <p>Selecting the inappropriate type may cause the value to be changed to NULL.</p> <p>New Behavior: The types are checked prior to execution; and the ambiguous cases are rejected;</p>

Hortonworks Bug ID	Apache Component	Apache JIRA	Summary	Details
				<p>FAILED: SemanticException Schema of both sides of union should match: Column _c0 is of type int on first table and type string on second table. Cannot tell the position of null AST. (state=42000,code=40000)</p> <p>The query should be clarified with explicit casts.</p>
BUG-80021	Oozie	N/A	Modify references to yarn-client mode for Oozie Spark action	<p>Summary: Yarn-client mode for the Spark action is not supported.</p> <p>Component Affected: Spark action in Oozie</p> <p>Scenario: The yarn-client mode of the Spark action is no longer supported as of HDP 2.6.0.</p> <p>New Behavior: If you use yarn-client mode in Oozie or Falcon workflows, you must change the workflow to use yarn-cluster mode instead. Workflow Manager automatically converts imported workflows to yarn-cluster mode.</p>
BUG-85566	Ranger	RANGER-1727	Ranger allows user to change an external user's password with 'null' old password	<p>Summary: Ranger allows user to change an external user's password</p> <p>Scenario: External users password change should be performed at the external source (LDAP/AD etc). But having an ability to change the password via Ranger API (although it won't change the password in the source system) is not useful.</p> <p>Previous Behavior: API call to change external user's password was allowed (although this will not change the password in actual external source)</p> <p>New Behavior: Now, external user password change cannot be done via API.</p>

1.8.11. Mahout

In HDP-2.3.x and 2.4.x, instead of shipping a specific Apache release of Mahout, we synchronized to a particular revision point on Apache Mahout trunk. This revision point is after the 0.9.0 release, but before the 0.10.0 release. This provides a large number of bug fixes and functional enhancements over the 0.9.0 release, but provides a stable release of

the Mahout functionality before the complete conversion to new Spark-based Mahout in 0.10.0.

The revision point chosen for Mahout in HDP 2.3.x and 2.4.x is from the "mahout-0.10.x" branch of Apache Mahout, as of 19 December 2014, revision 0f037cb03e77c096 in GitHub.

In HDP-2.5.x and 2.6.x, we removed the "commons-httpclient" library from Mahout because we view it as an obsolete library with possible security issues., and upgraded the Hadoop-Client in Mahout to version 2.7.3, the same version used in HDP-2.5. As a result:

- Previously compiled Mahout jobs will need to be recompiled in the HDP-2.5 or 2.6 environment.
- There is a small possibility that some Mahout jobs may encounter "ClassNotFoundException" or "could not load class" errors related to "org.apache.commons.httpclient", "net.java.dev.jets3t", or related class name prefixes. If these errors happen, you may consider whether to manually install the needed jars in your classpath for the job, if the risk of security issues in the obsolete library is acceptable in your environment.
- There is an even smaller possibility that some Mahout jobs may encounter crashes in Mahout's hbase-client code calls to the hadoop-common libraries, due to binary compatibility problems. Regrettably, there is no way to resolve this issue except revert to the HDP-2.4.2 version of Mahout, which may have security issues. Again, this should be very unusual, and is unlikely to occur in any given Mahout job suite.

BUG-50023	PHOENIX-3916	Phoenix	<p>Description of Problem: The hbck repair tool sometimes generates local indexes that are inconsistent with table data when overlapping regions are encountered.</p> <p>Workaround: If you know the database schema, fix this issue by dropping and recreating all local indexes of the table after the hbck tool completes operation. Alternatively, rebuild the local indexes using the following ALTER query:</p> <pre>ALTER INDEX IF EXISTS index_name ON data_table_name REBUILD</pre>

BUG-80901	N/A	Zeppelin	<p>Component Affected: Zeppelin/Livy</p> <p>Description of Problem: This occurs when running applications through Zeppelin/Livy that requires 3rd-party libraries. These libraries are not installed on all nodes in the cluster but they are installed on their edge nodes. Running in yarn-client mode, this all works as the job is submitted and runs on the edge node where the libraries are installed.</p>

Hortonworks Bug ID	Apache JIRA	Apache Component	Summary
			<p>In yarn-cluster mode, this fails because the libraries are missing.</p> <p>Workaround: Set the location in <code>spark-defaults.conf</code>. For Livy, you will need to set <code>livy.spark.jars</code> (the HDFS location) in <code>livy interpreters.conf</code>. Both are globally applicable. The jars need to be present on the livy machine in both cases. Updating livy conf is preferable since it affects only the Zeppelin users.</p>
BUG-81637	N/A	Spark	<p>Description of Problem: Executing concurrent queries over Spark via Spark1-llap package spawns multiple threads. This may cause multiple queries to fail. However, this will not break the spark thrift server. Spark 1.6 is built using Scala 2.10, which is where this issue manifests (i.e. "synchronize reflection code as scala 2.10 reflection is not threadsafe self"). This issue was subsequently fixed in Scala 2.11 based on this patch https://issues.scala-lang.org/browse/SI-6240.</p> <p>Associated error messages:</p> <ul style="list-style-type: none"> <code>scala.reflect.internal.Symbols\$CyclicReference: illegal cyclic reference involving class LlapContext</code> <code>SparkExecuteStatementOperation: Error running hive query: org.apache.hive.service.cli.HiveSQLException: scala.reflect.internal.Symbols\$CyclicReference: illegal cyclic reference involving class LlapContext</code> <p>Workaround: Isolate the broken queries and re-run them one by one. This will limit the query to one spawned thread.</p>

1.12. Documentation Errata

The following section contains late additions or corrections to the product documentation.

1.12.1. RangerUI: Escape of policy condition text entered in the policy form

Component Affected: Ranger

1.12.1.1. Description of Problem

If a user wants to create policy with custom policy conditions and the expression or text contains special characters, then policy enforcement will not work. Special characters are converted into ASCII before saving the policy into the database.

Special Characters: & < > " ` '

For example, the condition `tags.attributes['type']='abc'` would get converted to the following once the policy is saved: User can see the policy condition with these chars by opening policy in edit mode.

```
tags.attds[&#x27;dlds&#x27;]=&#x27;cssdfs&#x27;
```

You can see the policy condition with these characters by opening the policy in edit mode.

1.12.1.2. Workaround

1.12.1.2.1. Option #1: Create/Update policy via Ranger Rest API

REST URL: `http://<host>:6080/service/plugins/policies`

Creating policy with policy condition:

The below example will create policy with tags as ``tags-test`` and assign it to ``public`` group with policy condition as `tags.attr['type']=='abc'` by selecting all hive component permission like `select, update, create, drop, alter, index, lock, all`.

Example:

```
curl -H "Content-Type: application/json" -X POST http://localhost:6080/service/plugins/policies -u admin:admin -d
```

```
{ "policyType": "0", "name": "P100", "isEnabled": true, "isAuditEnabled": true, "descr
{ "tag": { "values": [ "tags-
test"], "isRecursive": "", "isExcludes": false } }, "policyItems":
[ { "groups": [ "public"], "conditions": [ { "type": "accessed-after-
expiry", "values": [] }, { "type": "tag-expression", "values":
[ "tags.attr['type'] == 'abc' ] } ] }, "accesses":
[ { "type": "hive:select", "isAllowed": true },
{ "type": "hive:update", "isAllowed": true },
{ "type": "hive:create", "isAllowed": true },
{ "type": "hive:drop", "isAllowed": true },
{ "type": "hive:alter", "isAllowed": true },
{ "type": "hive:index", "isAllowed": true },
{ "type": "hive:lock", "isAllowed": true },
{ "type": "hive:all", "isAllowed": true } ] }, "denyPolicyItems":
[], "allowExceptions": [], "denyExceptions": [], "service": "tagdev" }
```

Update existing policy with policy condition:

The below example will update policy with tags as `tags-test` and assign it to `public` group with policy condition as `tags.attr['type'] == 'abc'` by selecting all hive component permission like select, update, create, drop, alter, index, lock, all.

REST URL: `http://<host-name>:6080/service/plugins/policies/<policy-id>`

Example:

```
curl -H "Content-Type: application/json" -X PUT
http://localhost:6080/service/plugins/policies/18 -u
admin:admin -d '{"id":18,"guid":"ea78a5ed-07a5-447a-978d-
e636b0490a54","isEnabled":true,"createdBy":"Admin","updatedBy":"Admin","create
{ "tag": { "values":
[ "tags"], "isExcludes": false, "isRecursive": false } }, "policyItems":
[ { "accesses": [ { "type": "hive:select", "isAllowed": true },
{ "type": "hive:update", "isAllowed": true },
{ "type": "hive:create", "isAllowed": true },
{ "type": "hive:drop", "isAllowed": true },
{ "type": "hive:alter", "isAllowed": true },
{ "type": "hive:index", "isAllowed": true },
{ "type": "hive:lock", "isAllowed": true },
{ "type": "hive:all", "isAllowed": true } ], "users": [], "groups":
[ "public"], "conditions": [ { "type": "ip-range", "values":
[ "tags.attributes['type'] == abc" ] } ], "delegateAdmin": false } ], "denyPolicyItems":
[], "allowExceptions": [], "denyExceptions": [], "dataMaskPolicyItems":
[], "rowFilterPolicyItems": [] }'
```

1.12.1.2.2. Option #2: Apply Javascript changes

Steps to update JS file :

1. Find out PermissionList.js file under `/usr/hdp/current/ranger-admin`
2. Find out definition of renderPolicyCondition function (line no:404).

3. 3. Remove below line from that function i.e under display function(line no:434)

```
val = _.escape(val);//Line No:460
```

After removing the above line, the Ranger UI will allow you to create policies with policy condition that can contain special characters and policy evaluation will be successful for the same policy.

1.12.2. Workaround for Ranger service check failure

([RANGER-1607](#): Workaround for Ranger service check failure while upgrading to HDP 2.6.2 from previous HDP versions.

Note

Only when Ranger is SSL enabled.

This issue arises when attempting to upgrade to HDP-2.6.1 from previous HDP versions through Ambari. Ambari uses a curl call to do a service check to Ranger service in Ambari. If the JDK version used by Ambari is JDK-1.7, the curl call will fail with the below error:

```
curl: (35) error:14077410:SSL routines:SSL23_GET_SERVER_HELLO:sslv3 alert handshake failure
```

The reason for this error is the tomcat version used in Ranger is Tomcat-7.0.7*. Using JDK-1.7 conflicts with default ciphers provided in Tomcat-7.0.7*.

You can resolve this issue in two ways:

- Update the JDK used in Ambari from JDK-1.7 to JDK-1.8 (see the section [Change the JDK Version](#) in the Ambari Reference Guide).
- If you want to continue supporting a JDK-1.7 environment:
 1. Add the property `ranger.tomcat.ciphers` in the `ranger-admin-site` section in your Ambari Ranger configuration with the below value:

```
SSL_RSA_WITH_RC4_128_MD5, SSL_RSA_WITH_RC4_128_SHA,  
TLS_RSA_WITH_AES_128_CBC_SHA, SSL_RSA_WITH_3DES_EDE_CBC_SHA
```

2. If you environment is configured for Ranger-KMS, add the property `ranger.tomcat.ciphers` in the `ranger-kms-site` section in your Ambari Ranger configuration with the below value:

```
SSL_RSA_WITH_RC4_128_MD5, SSL_RSA_WITH_RC4_128_SHA,  
TLS_RSA_WITH_AES_128_CBC_SHA, SSL_RSA_WITH_3DES_EDE_CBC_SHA
```

Note

The noted values are working examples and may not be indicative of your environment. Ensure that the way you set these properties matches how your environment is configured.
